Water Detection System

Remote Monitoring System

Water Detectin System

With the success of this exhibition, we are committing to provide the utmost support and service to our customer. And we are looking forwards to hear you in order to provide the turnkey solution for Data Centre Facility.

Product Highlight

Power Distribution Unit – Amazing

Amazing PDU enables you to monitor and manage power environments through comprehensive control of PDU. Ensure the high performance required for data centre. Provides reliable and efficiently power management and monitoring. Amazing PDU is the ideal solution for your growing data centre.

Amazing PDU

Amazing Metered Rack PDU

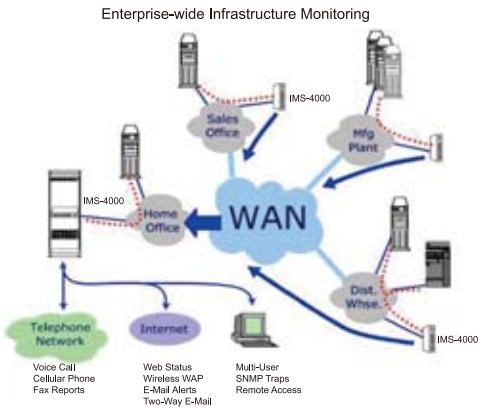

- Built-in true RMS current meter
- Local audible alarm for power consumption over warning and overload limit

Amazing Switched Rack PDU

- Built-in True RMS current meter
- Power on/off the PDU outlets individually via network

Remote Monitoring System – Sensaphone

SENSAPHONE® Remote Monitoring Solutions

The Sensaphone IMS-4000 System suitable for data centre, it can provides complete monitoring for your computer facility and entire infrastructure, which includes the environment, the physical security, and the network operation.

The Sensaphone IMS-4000 System is a stand-alone infrastructure monitoring system with an integrated voice and modem, an internal UPS, flash-disk storage, and a web server, in a simple-to-install 1U rack-mountable package. From the wide array of its plug-and-play monitoring devices to its sophisticated software, the IMS-4000 is a complete, flexible, integrated system.

Water Leakage Detection System – TTK

FG-SYS System Technology

The control unit indicates an alarm as soon as liquid comes into contact with the sense cable. It can protect against liquid leaks, such as water-based liquid, acid, hydrocarbons or solvents. In addition to the date and time of the incident, the name of the sense cable and the exact position of the leak are shown on the LCD-Display. The control unit enables up to 180 loops to be monitored simultaneously. During the alarm status on one loop all other loops remain active. Through the use of a scaled general arrangement table, the exact position of a leak can be easily identified.
